Arbor Hills Landfill, Inc.

Ridge Wood Elementary Hydrogen Sulfide (H₂S) Monitoring: 24-hour average concentrations August 2024

For the August 1 - 31, 2024 monitoring time period, the following is noted:

- 1) Equipment Operation
 - a. SPM Flex functioning and operations were within the manufacturer specified ranges except as noted below.
- 2) Data Downloading
 - a. No malfunctions or issues with data downloading were identified.
- 3) Meteorological Conditions
 - a. Strong storms occurred on 8/28 and 8/29, resulting in power loss. Data code "AV" was used for the 24-hour time periods effected by the power loss.
- 4) Maintenance
 - a. Barr performed routine maintenance on August 6. Minimal effect on the 24-hour average concentration was observed.
- 5) Audits
 - a. No audits of the network were conducted during the time period.
- 6) Data Average Air Concentrations
 - a. Average concentrations are calculated from 10-second readings obtained from the SPM Flex by the data logger.
 - The SPM Flex output range is 0.000 to 9.999 parts per million (0 to 9,999 parts per billion, ppb).
 Therefore, an average air concentration may be derived from a data set that includes one or more zero values.
 - c. A reported average concentration is a rounded value, for example:
 - i. A calculated average concentration of 0.0 to 0.9 ppb is identified as "<1 ppb"
 - ii. A calculated average concentration of 1.6 ppb is rounded to 2 ppb
 - iii. A calculated average concentration of 3.1 ppb is rounded to 3 ppb
- 7) Data Report (24-hour Average Concentrations)
 - a. No notifications required to be sent to Ridge Wood Elementary for elevated H₂S.¹
 - b. All 24-hour average concentrations are low; all < 1 ppb.²

Please contact the following Arbor Hills Landfill or Barr staff if you have questions about the air monitoring being conducted at the Ridge Wood Elementary School.

| Arbor Hills Landfill, Inc. | Anthony Testa | C (734) 718-4262 | anthony.testa@gflenv.com |
|----------------------------|----------------|--------------------|--------------------------|

| Barr Engineering | Luke Mackewich | n O (734) 922-4429 | LMackewich@barr.com |

¹ Notifications to be sent to the Ridge Wood Elementary School if a 15-minute average concentration exceeds 750 ppb (0.75 ppm, USEPA Acute Exposure Guideline Value) or a 24-hour average concentration exceeds 72 ppb (0.072 ppm).

² The 24-hour guideline value from the Michigan EGLE is 72 ppb (~100 microgram per cubic meter of air). A 24-hour air concentration that is below the guideline value is interpreted to mean there is no appreciable risk to a person breathing the air. However, a 24-hour air concentration that exceeds the guideline value does not mean that adverse health effects have or will occur as there are safety factors built into the guideline value to be protective of human health. But air concentrations that exceed the guideline value indicate that further review and assessment of the monitored air concentrations is needed.
